                                   This invention describes novel nucleic acids (I; designated LOBO (long bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The mucleic acid molecules, proteins and antibodies can be used in animals, especially a transgenic mouse for grene therapy. The methods associated with bone development, e.g. spondyloepiphysal dysplasia and in the method of the invention
                                                                                                                                                                                                                                                                                               Example 3; Page 69-97; 391pp; German.
                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding proteins which influence bone development, useful for treating and studying bone disorders.
                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 1999-601320/51.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel nucleic acids (1; designated LOBO (long bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The mucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The methods animals, especially a transgenic mouse for the srudy of diseases associated with bone development, e.g. spondyloepiphysal dysplasia and in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                 This invention relates to a novel recombinant carcinoma-associated (CA) CC nucleic acid comprising a fully defined genomic, mRNA or coding sequences CC of mouse Rorc gene or human RORC gene, mouse mCG1538 or human gene BAT1, CC mouse Iqgapl gene or human IQGAP1 gene, mouse EQF29 gene or human CC hCG27579 gene, mouse MCG99110 gene or human hCG27579 gene, mouse MCG99110 gene or human hCG27579 gene, as given in CC cancer cells, preferably lymphatic, breast, prostate or pithelial cells. CC A compound which modifies the expression of the CA genes or bind to CC carcinoma-associated proteins (CAP) may have cytostatic activity and the gequences of the invention may enable the use of gene therapy or a CC development of an anticancer vaccine. Therefore the invention may be CC useful for diagnosis and treatment of carcinomas, especially lymphoma CC carcinoma, breast cancer and prostate cancer. The CA genes may also be CC useful as DA vaccines and for generating animal models of carcinomas. CC requence is that of the mouse Pp3cc gene genomic DNA ccc contention.

                                                                                                                                                    The invention relates to recombinant carcinoma associated (CA) nucleic CC acid sequences from mouse and human (ADA)1482-ADA03094), and to CC carcinobinant carcinoma associated proteins (CAP) encoded by them. The CC invention also encompasses expression vectors and host cells comprising a CC cA nucleic acid, a polypeptide (especially an antibody) that specifically cC binds to the protein, and a biochip comprising CA nucleic acid or CC fragments thereof. The sequences of the invention were identified using CC oncogenic retroviruses, which insert into the genome of the host organism CC at random. Many of these do not carry transduced host oncogenes or CC pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host CC pathogenic trans-acting viral genes, meaning that cancer incidence is a Cd irect consequence of the effects of proviral integration into host CC protooncogenes. The CA nucleic acid sequences can be used to diagnose CC carcinoma (sepecially breast cancer, prostate cancer, lymphoma or CC leukaemia) or a propensity to carcinoma by determination of the sequence CC acides, proteins and antibodies are also useful as CC therapeutic agents and in screening and evaluating drug candidates. The CC present sequence represents a specifically claimed murine CA nucleic acid sequence of the invention. Note: The complete sequence data for this CC patent did not form part of the printed specification, but was obtained cid electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a mouse gene of the invention.
                                                                                                                                                                                                                                                                                                                            Sequence 68233 BP; 18767 A; 14103 C; 14729 G; 20634 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                 ঠ
                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel nucleic acid representing a synthetic CC Bax gene. The Bax gene of the invention is useful for identifying Bax-CC resistant yeast or fungi, identifying, or obtaining and identifying CC Candida spp. sequences that are differentially expressed in a pathway CC eventually leading to programmed cell death or identifying inhibitors or clinhibitor sequences of Bax-induced cell death or identifying inhibitors or clinhibitor sequences of Bax-induced cell death or identifying inhibitors or clinhibitor sequences of Bax-induced cell death or identifying inhibitors or clinhibitor sequences of Bax-induced cell death or identifying inhibitors or clinhibitor sequences of Bax-induced cell death or identifying inhibitors or clinhibitor sequences or for the gene therapy. The composition of the sociated nucleic acids, polypeptides, pharmaceutical compositions, antisense molecules and antibodies are useful as medicaments or in corporating a medicament for treating, preventing and/or alleviating compositions, as cancer, or for preventing appoptosis in certain diseases. The compounds or proparting a medicament for modifying the endogenic flora of humans and cother mammals. The vaccine is useful for immunising against yeast or companiant infections. Apoptosis-related diseases include autoimmune disease, concerning and infections related with viral infections or neurodegenerations. This sequence represents a polynucleotide associated with the Bax gene described in the disclosure of the invention
                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                          epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) disorders, or infections. It is also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of NAAP. The NAAP or its fragments are useful in screening compounds for which acts as their agonist or antagonist. The microarray is useful in monitoring or measuring protein-protein interactions, drugts agent interactions, and gene expression profiles. NAAP DNA is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human nucleic acid associated proteins (NAAP) and their corresponding nucleic acid sequences. The invention is usefu in diagnosing, treating and preventing diseases or conditions associate with the decreased expression or overexpression of NAAP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human nucleic acid associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression e.g. cancer, AIDS, atherosclerosis, epilepsy, or

                                                                                                                                                                                                                                     The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) variant protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) off 12 glutamates, in an acidic stretch of C1 ls amino acids (amino acids 294-311), located in the third intracellular three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR C2 gene is located on chromosome 2. Alpha2-AR mediate many off the C3 gene is located on chromosome 2. Alpha2-AR mediate many of the C4 gene is located on chromosome 2. Alpha2-AR mediate many of the C5 gene is located on chromosome 2. Alpha2-AR mediate many of the C6 ginephrine. An antagonist of alpha2B-adrenoceptor is useful for treating C6 disease involving vascular contraction of coronary arteries and a C6 clinically expressed as coronary heat disease (CHD), unstable chronic C6 corm or acute myocardial infarction (AMI). Alpha2B-AR gene is used in

                                                                                                                                                                                              Sequence 1344 BP; 219 A; 459 C; 400 G;
                                                                                                                                                                                                                      The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha

                                                                                                                                                                                                                                                                                                          á
                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel murine cDNAs produced using gene trap technology. The OMNIBANK gene trapped sequences (GTSs) are individually identified novel genes, and are useful in functional genomic analysis, in the discovery and development of new therapeutic and disgnostic agents, for gene discovery, for disgnostic gene expression analysis, for cross species hybridisation analysis, and for genetic manipulations such as antisense inhibition or gene targeting. The polynucleotides of the invention are also useful for isolating cDNAs, genomic clones or full-length genes/polynucleotides, or their homologues, genomic clones or full-length genes/polynucleotides, or their homologues, theterologues, paralogues or orthologues, that are capable of hybridising to one or more of the new murine polynucleotide sequences. The polynucleotides are also useful for identifying the coding regions of the murine genome, and as hybridisation probes. ABX90657-ABX91862 represent the murine GTSs of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                      CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, cand in recombinant production of (II). The polymucleotides are also used con diagnostics as expressed sequence tags for identifying expressed cc genes. (I) is useful in gene therapy techniques to restore normal cc extivity of (II) or to treat disease states involving (II). (II) is cc useful for generating antibodies against it, detecting or quantitating a cc polypeptide in tissue, as molecular weight markers and as a food cc supplement. (II) and its binding partners are useful in medical imaging cof sites expressing (II). (I) and (II) are useful for treating disorders cinvolving aberrant protein expression or biological activity. The cc involving aberrant protein expression or biological activity. The cc diagnostics, forensics, gene mapping, identification of mutations in cc diagnostics, for senetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cc amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from MIDO at fine intention into intention into his or sequence.

CC trap technology. The OMNIBANK gene trapped sequences (GTSs) are
CC individually identified novel genes, and are useful in functional genomic
CC analysis, in the discovery and development of new therapeutic and
CC analysis, for cross species hybridisation analysis, for cross species hybridisation analysis, for cross species hybridisation analysis, and for gene expression
CC genomic clones or the invention are also useful for isolating cDNAs,
CC to one or more of the new murine polymucleotides or their homologues,
CC polymucleotides are also useful for isolating cDNAs,
CC to one or more of the new murine polymucleotides or their homologues,
CC polymucleotides are also useful for identifying the coding regions of the murine grows, and as hybridisation probes. ABX90657-ABX91862 represent
CC did not form part of the printed specification, but was obtained in
CC seqdata.uspto.gov/psinsDIDEntry hem)

The invention describes an isolated NOVX polypeptide (I) comprising a CC 214, 395, 1098, 134, 427, 1333, 407, 806, 804, 1253, 382, 1045, 294, 496, CC 506, 759, 390, 133, 215, 240, 1069, 116, 439, 1138, 477, 316, 269, 219, CC 305, 406, 460, 365, 380, 829 or 326 amino acids fully defined in the CC specification, and the mature form of S1. (I) is useful for treating or preventing a pathology associated with (I) in a subject, preferably CC human, or for identifying an agent that binds to (I), where the agent is a cellular receptor or a downstream effector (I), a polynucleotide (II) CC encoding (I) or an anti-(I)-antibody (V) is useful treating or preventing CC disorders or syndromes such as autoimmune disease, allergies, Alzheimer's CC disease, stroke, Parkinson's disease, Huntington's disease, multiple CC disease, addiction, anxiety, pain, diabetes, glomerulonephritis, CC systemic lupus erythematosus, astima, scleroderma, graft versus host CC disease, pancreatitis, obesity, ulcers, anaemia, cancer, trauma, viral, CC disease, ill) or parasitic infections, cardiomyopathy, atherosclerosis, CC disease. (I), (II) or (V) is useful in screening assays, detection assays (e.g., chromosomal mapping, tissue typing, forensic biology), predictive CC medicine (e.g., diagnostic assays, and in methods of treatment (e.g., therapeutic and prophylactic). (II) is useful in gene therapy, to express CC (I), to detect NOVX mRNA or a genetic lesion in a NOVX gene, and to constant or or or only artivity. This segments encodes a novel burner NOV portein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-JUN-2001; 2001US-0296418P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention describes an isolated NOVX polypeptide (I) comprising a CC 214, 395, 1998, 134, 427, 133, 407, 806, 804, 1253, 329, 1730, 176, 583, CC 506, 759, 390, 133, 215, 240, 1069, 116, 439, 1138, 477, 316, 269, 219, CC 305, 406, 460, 355, 380, 829 or 326 amino acids fully defined in the CC preventing a pathology associated with (I) in a subject, preferably CC a cellular receptor or a downstream effector. (I), where the agent is C encoding (I) or an anti-(I)-antibody (V) is useful for treating or CC disorders or syndromes such as autoimmune disease, altergies, Alzheimer's CC sclerosis, addiction, anxiety, pain, diabetes, glomerulonephritis, CC disease, pancreatitis, obesity, ulcers, anaemia, cancer, treams, viral, CC disease, acquired immundeficiency syndrome (AIDS) or Crohn's CC disease. (I), (II) or (V) is useful in screening assays, detection assays, credicine (e.g., chromosomal mapping, tissue typing, forensic biology), predictive cc trials and pharmacogenomic), and in methods of treatment (e.g., cromosomal mapping, tissue typing, forensic biology), predictive cc condulate NOVX activity. This sequence encodes a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel purified or isolated nucleic acids of CC essential genes of Aspergillus fumigatus. The isolated nucleic acids of CC the invention are used to treat or prevent infections by a pathogenic CC organism such as A. fumigatus, to treat a non-infectious disease in a cc biofilm comprising A. fumigatus, to rontain contamination of an object CC by A. fumigatus, or to prevent or inhibit formation on a surface of a cc biofilm comprising A. fumigatus. The polymucleotides are useful for corganisms invade or reside, for comparing with the pathogenic CC similar biochemical activity and/or function, screening or corganisms invade or reside, for comparing with the DNA sequence of A. CC sequences of other related or distant pathogenic organisms to identify duplicated genes or paralogues having the same or cc making oligomers for attachment to a nucleic acid array for examination CC making oligomers for attachment to a nucleic acid array for examination cresponse, and for identifying polynucleotides encoding the other protein for identifying polynucleotides encoding the other protein constitution. The polypeptides may be used to raise antibodies or to clicit immune response, as a reagent in assays designed to quantitatively cate correlative receptors or ligands in the case or virulence cc factors. This polynucleotide sequence represents one of the essential cc genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC encoding an Arabidopsis thaliana transcription factor, their variants, CC complements, fragments, or related polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC sequence identity, where the plant, or the plant exhibits an altered CC phenotype as compared to a wild-type or reference plant, or the plant can be plant to the plant compared to a wild-type or reference plant, or the plant CC phenotype as compared to a wild plant. Also included CC are a transgenic plant trait as compared to a wild plant. Also included CC are a transgenic plant comprising the polynucleotides, a computer CC readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant Sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a computed control of the sequence or an antisense nucleic acid, inserting the CC encodes a polypeptide or an antisense nucleic acid, inserting the CC introducing the vector into a plant or a cell of a plant to overexpress control of the polypeptide or antisense nucleic acid, thereby production of control of a selecting for a modified trait (e.g. increased production of control of a plant to overexpress control of a plant by tolerance, herbicide resistence, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 polynucleotides encoding an A.
                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                           The invention relates to a transgenic plant, comprising a recombinant polynucleotide that alters the plant's disease tolerance or resistance to when compared with the same trait of another plant lacking the crecombinant polynucleotide. The recombinant polynucleotide of any of so transcription factor proteins at least 6 consecutive amino acids of any of 56 transcription factor proteins consecutive amino acids of any of 56 transcription factor proteins consecutive amino acids of any of 56 transcription factor proteins consecutive amino acids of aplant (by: (a) transformed plants; and (c) the selecting a plant; attains a plant polynucleotide, (c) comparing the database sequence with the polypeptide or polynucleotide cited above; (c) selecting a database sequence that meets the selected sequence criteria; and (d) transforming the selected database sequence (c) approviding a test polynucleotide; (b) hybridising the test polynucleotide at low stringency with the recombinant polynucleotide in a plant to alter a trait of the plant. The transgenic plant is useful in plant breeding, particularly for generating plants with improved tolerance or resistance to mathogens and polants. The

                                                                                                                                      The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant, such as an alteration in a plant growth characteristic, e.g. growth rate, flower senescence. Sequence information related to the polynucleotides and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the cDNAs of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note=Worgan: Kidney/Brain; Vector: pBACe3.6; Site_1: EcoRI; Site 2: EcoRI; Female C57BL/6J mouse kidney and/or brain genomic DNA was isolated and partially digested with a combination of EcoRI and EcoRI Methylase. Size selected DNA was cloned into the pBACe3.6 vector at the EcoRI sites. The ligation products were transformed into DH10B electrocompetent cells (BRL Life Technologies).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mol_type="genomic DNA"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Heil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                      /clone_lib="Sugano:mouse kidney mkia"
/note="Organ: kidney; Vector: pME185-FL3; Site 1: DraIII
(CACCATGTG); Site 2: DraIII (CACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct DraIII sites of the pME185-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG), XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
conservated by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."

                                                                                                                                                                                                                                                                                                                                              /note="Vector: pCMV-SPORT6 (Invitrogen); Site 2: Not1; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA). Intramylational Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). Genome Res. 1: 153-158 (2001). [PMID: 11544199]. Genome Res. 1: 1553-158 (2001). [PMID: 11544199]). Ref. cells were obtained from Dr. Brigid L.M. Hogan and RNA was prepared by Dr. Mark G. Carter (NIH/NIA-IRP). Es cell-guilfied FBS, 0.1mM non-essential amino sodium pyruvate, 0.1 mM beta-mercaptoethanol, and 10^7 synthesized with an Oligo(dT) primer [Invitrogen: 2.5 up of total RNA, treated with T4 DNA polymerase, and to Lone-linker LJ-Sal4, purified by phenol/chloroform, and to Lone-linker LJ-Sal4, purified by phenol/chloroform, and cDNAs were amplified by long-range high fidelity PCR using then purified by phenol/chloroform and Centricon 100. Then, the Ex Taq polymerase (Takara) with a primer Sal4-S. The then purified by phenol/chloroform and Centricon 100. Then procedure by Dr. Kazuhiro Kondo at AISIN Cosmos. Then the CDNAs were cloned into SalI/NotI site of transformed with the ligation mixture by the standard The library was constructed by Yulan Plao and Kazuhiro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            quality sequence stop: 330

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            80
